Fluxora

Cash-flow decisions for small businesses

Concept illustration

SKLab

Topic E / SME Finance Copilot
2026 Shenzhen International FinTech Competition

The cash timing problem

An invoice can arrive after payroll is due

USD 10,000

Recorded USD cash

EUR 1,000

A separate currency balance

Will the business stay above its cash floor before the next collection?

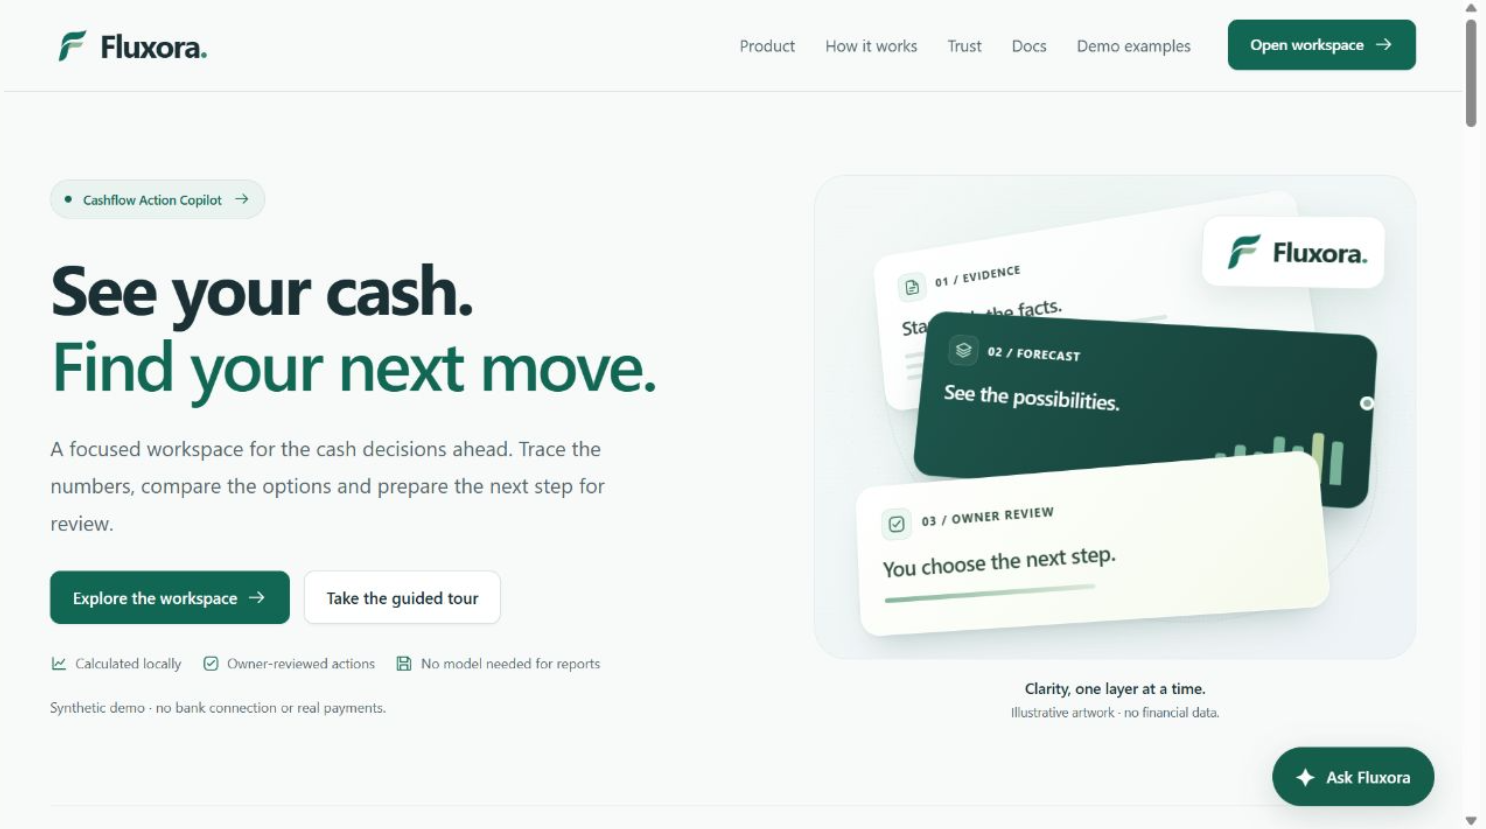

Synthetic Atlas example, snapshot 16 October 2026. Expected collections remain conditional.

The owner workspace

One place to inspect the next decision

Evidence, forecasts and reviewed actions have dedicated pages.

Direct reports work without a model key.

Actual local application screenshot. Hero artwork illustrates the concept.

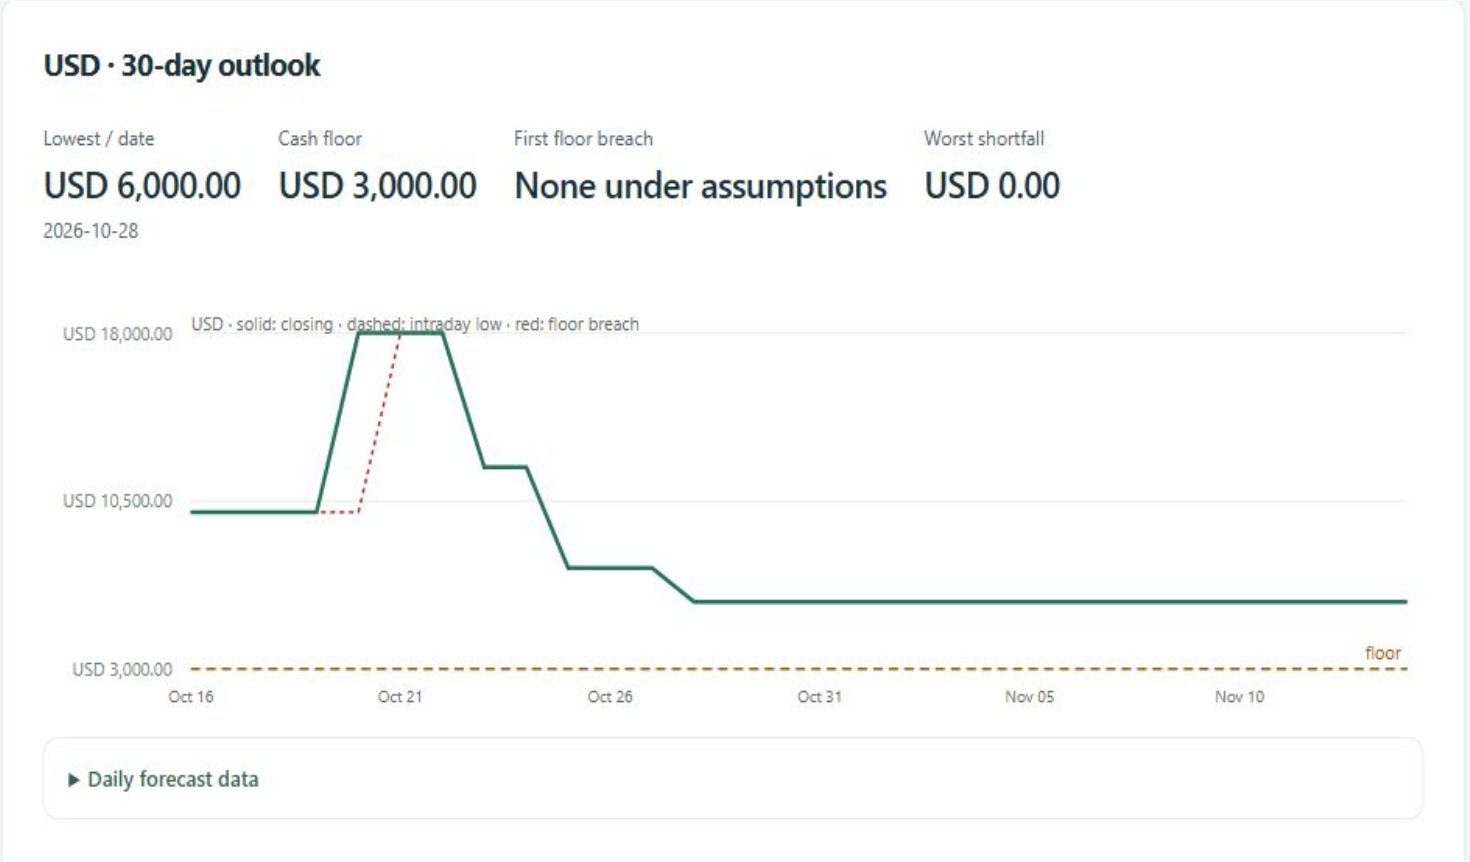

A forecast the owner can inspect

USD 6,000

Baseline minimum
28 October 2026

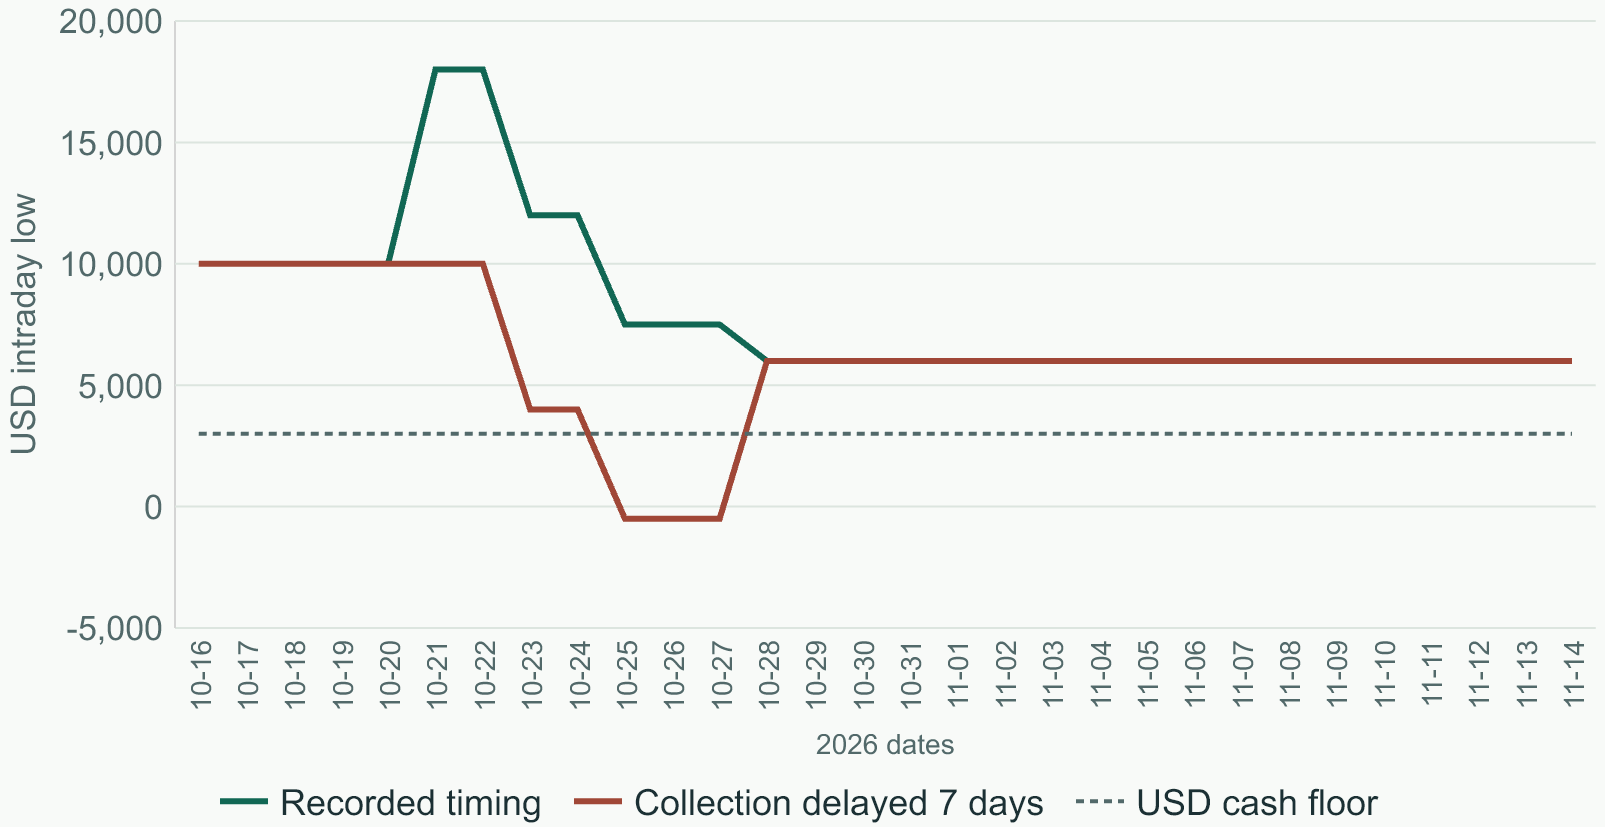

USD 3,000 cash floor

No projected floor breach under the recorded assumptions

Synthetic 30-day projection as of 16 October 2026. Currencies remain separate.

A seven-day delay creates a cash gap

Delayed minimum

USD -500

USD 3,500
below the cash floor

Synthetic timing scenario for inv-client-001. No receipt, agreement or consent changes.

One Send prepares supported work

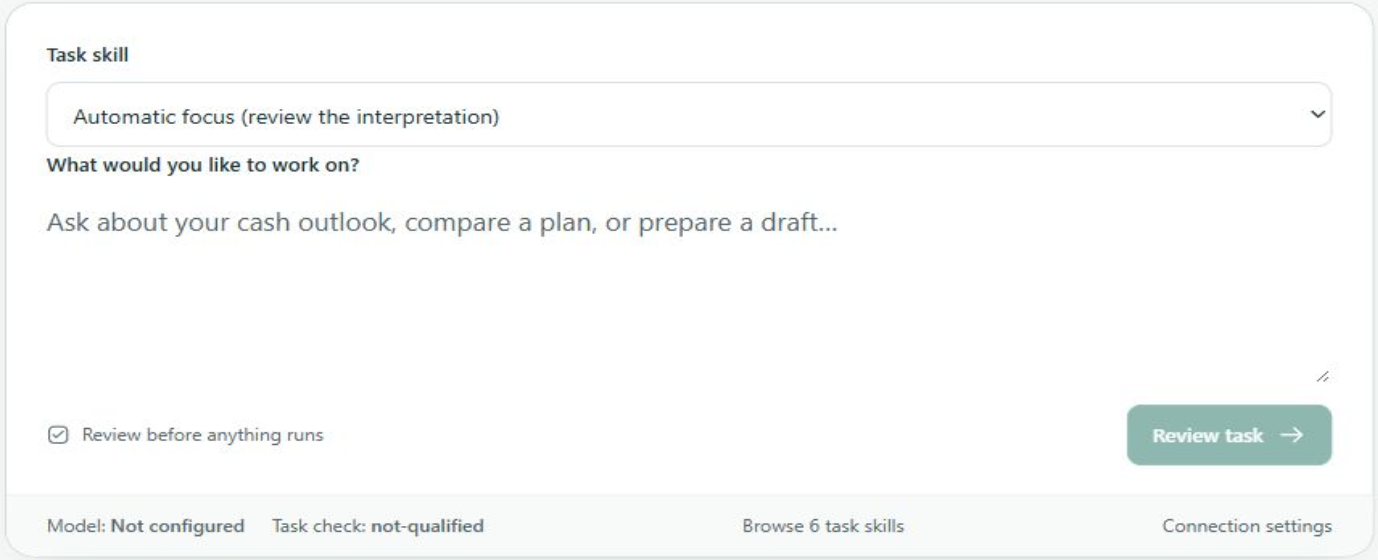

“Prepare an early-payment request draft for inv-client-001, USD 100 on 2026-10-22.”

Interpret and validate

Compute a report or DRAFT

Show the selected task

Keep final approval separate

Archived local UI, version 0.25.9, AI disconnected. Current UI uses Send with optional preview.

The owner retains approval authority

Step	Who can do it	Boundary
Read a report	Direct tools or the agent	Inspect assumptions and evidence
Prepare a DRAFT	The agent or an owner form	Preparation creates no approval
Approve local work	Owner, separately	Apply only the exact reviewed scope
Record consent or payment	Explicit source-backed owner step	The model cannot invent the event
Reconcile records	Separate matching workflow	An observation alone is not a match

No real bank connection, payment rail or counterparty messaging exists in this sandbox.

Evidence stays attached to the decision

Evidence supports a recorded fact

Import staging, settlement records and corrections preserve the audit trail.

Traceability cannot prove that every uploaded source is authentic or complete.

Concept illustration. Documents provide evidence, never authorization.

Telegram updates and owner decisions

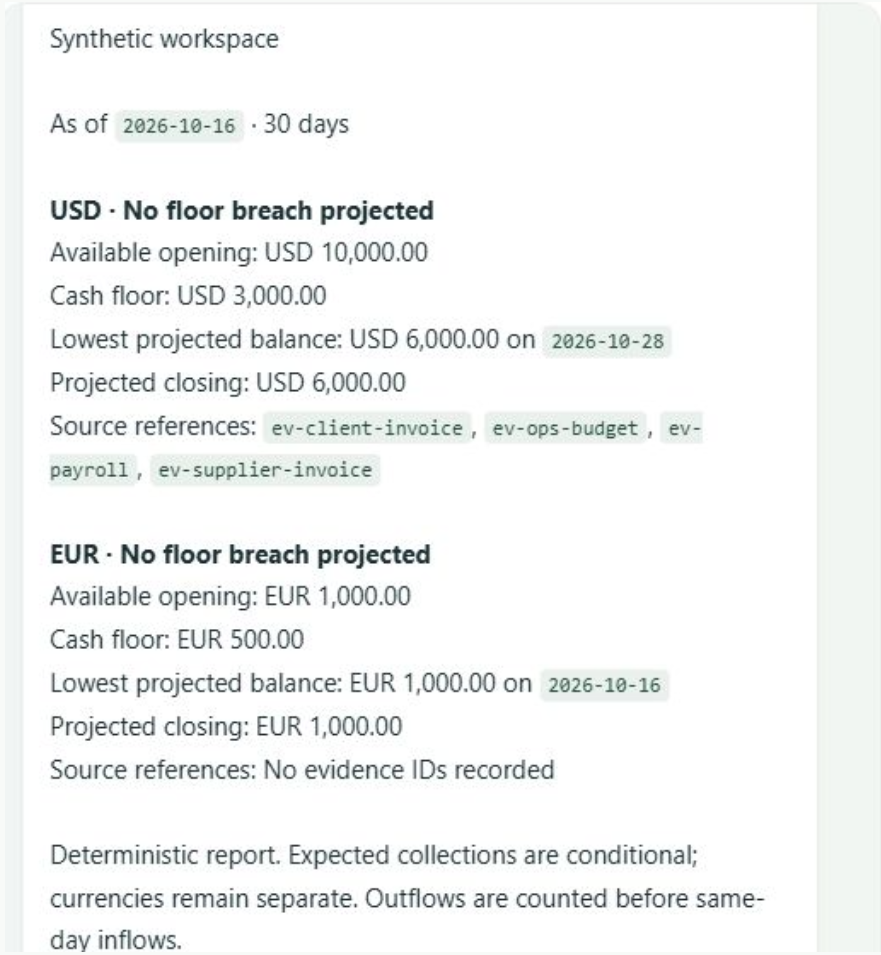

Browser practice

No Telegram account or token

Deterministic commands on a separate disposable lesson

Simulated delivery and explicit human review

Private Autopilot sends updates and exact DRAFT decision buttons to a paired owner.

Captured /forecast response. No real delivery.

Scheduled checks use local code

Local Autopilot

Five-minute checks when enabled

Changed data triggers analysis

Owner limits bound DRAFT preparation

Unchanged data uses a timed digest

AI for explicit instructions

The model selects a supported task

Local tools calculate financial results

Scheduled checks make zero AI calls

Exact approval remains with the owner

Restart preserves policy and accepted effects. Hosted checks run on the VPS. Private notifications use Telegram.

Verification and the remaining limits

Check	Measured result	Scope
Complete local suite	2,211 passed	Synthetic tests, HTTP stubs and mocks
Worker and restart	Passed	2 DRAFTs, separate decisions, no duplicates
Earlier live qualification	13 cases passed	8 model cases and 5 local guards
Rendered mobile review	Blocked	Browser disabled. 360 / 390px pending
Fresh-user walkthrough	No issues reported	User report. Detailed study log absent

Source 0.26.1. Finite tests and user feedback do not certify universal accuracy or production readiness.

Fluxora by SKLab

Cash timing, traceable evidence and work prepared for owner review

fluxora.sklab.cc/start

github.com/ShahadatTest/fluxora

Synthetic demonstration. No real bank connection or payment execution.

Feature coverage

Workspace	Available work
Overview and daily review	Cash position, priorities and upcoming obligations
Forecast and account funding	Daily outlooks, cash availability and payroll protection
Plans and scenarios	Timing changes, affordability and bounded alternatives
Evidence and ledger	Staged imports, source references and record review
Actions and approvals	DRAFT preparation and exact owner decisions
Settlement and recovery	Observed records, reconciliation, corrections and backups
Agent and Autopilot	Supported tasks, 6 skills, scheduled checks and bounded DRAFTs
Telegram companion	Browser simulation and paired private updates and decisions

Threat boundaries and known limitations

Risk	Implemented control	Remaining limit
Untrusted model output	Typed tasks, scope checks and exact review	A model can still misread intent
Provider failure or leaked error body	Deadlines, response bounds and sanitization	Availability and remote handling remain external
Replay or stale approval	Durable request identity and revision binding	Local storage and host security still matter
Misleading documents or attestations	Source references and explicit owner steps	Source authenticity is not independently proven
Public demo or private integrations	Isolated synthetic visitors, locked settings	No production identity system or bank integration

Windows SQLite backup paths have a documented length limitation. Use a short writable directory.

Demo access and reproducibility

Judge tour	https://fluxora.sklab.cc/start
Telegram practice	https://fluxora.sklab.cc/telegram/demo
Source and setup	https://github.com/ShahadatTest/fluxora

Local readiness check
python -m tools.local_setup --check

Direct reports and Telegram practice need no key. Public AI depends on provider availability and shared limits.
